

AMENDMENTS TO SPECIFICATION

On line 4 of the abstract, please replace the term “anther” with “another”.

On page 1, please amend the paragraph starting on line 32 as follows:

The vast majority of percutaneous breast biopsies are performed under art-disclosed stereotactic guidance techniques, and generally use a device known as the Mammotome® (by Johnson & Johnson) (e.g. biopsy or tissue removal device). The clip that is employed is generally prone to pinching a minute amount of breast tissue. Sometimes, the clip may fail to hold onto the tissue or the clip may migrate to a different undesired location.
